

A-TAG™ Pavement Markers

A-TAG markers have been designed to be embedded into concrete or asphalt. These brightly colored UV stable polypropylene markers are slightly recessed, so even snow-plows will not destroy them.

Durable

The warning message is molded into the tag and cannot be removed. The A-TAG is UV stabilized, will not fade or become brittle and has a ten year warranty.

Prevent Damage to Pipes and Cables

Permanent color coded markers embedded into the concrete or asphalt encourage people to call before digging in the area.

Colors

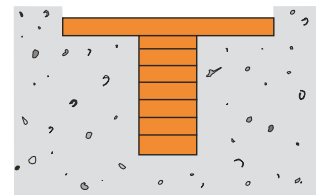

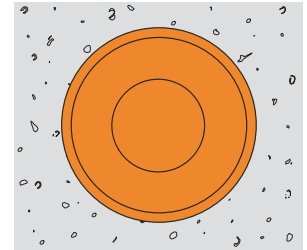

Standard colors are orange, yellow, blue, green, red and purple. Custom colors are available. Call for details.

Reassurance Marking

Use blank color coded A-Tags periodically along your trails to let people know they are still on the correct trail.

Distance Marking and Warning Lines

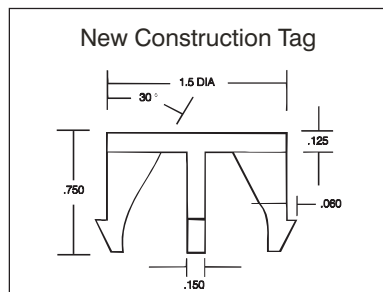

A series of A-Tags can be installed across the pathway, in combination with mileposts to let users know they have reached specific distances. The same concept can be used to alert people that crossing traffic or a street is just ahead. This type of pavement marking is especially useful for cyclists that may be moving quickly while looking down at the path and may miss marker posts on the side of the trail.

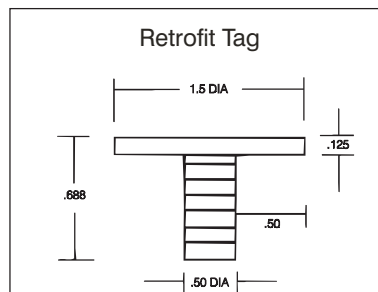

Slightly Recessed Retrofit Tag

EASY INSTALLATION

Simply place into soft concrete or asphalt and push down so it is slightly recessed.

Drill a hole with the retrofit A-Tag drill bit, then the tag is glued in place.
